Raindrops trickle into holes and cracks in the giant rocks.

After time tiny bits of rocks crumble and wash away.

Cracks grow into tunnels and rooms inside huge rocks to become caves.

Some caves form strange decorations that look like Lily pads.

Drops of water seep into a cave and hang on the ceiling and leave bits of rock behind.

They grow longer and hang down like icicles called stalactites.

Drops dip to the floor and grow into bumps, until they reach up toward the ceiling. They are called stalagmites.

It is up to us to protect our caves and all the creatures that dwell there.
